

Motorcycle gel seat pad fitting instructions

I recently bought a medium custom block of the [DebbonAir](#) gel to fit in the seat of my Suzuki Bandit 600.

I started off with my seat in its standard form

I removed all the staples down one side and top and bottom, and peeled the cover across to one side to leave the inner foam exposed,

Once the foam was exposed I measured out the gel and drew the shapes out on my seat to the right size and shape

I then used a craft knife to slowly cut away the foam to about an inch in depth and to the shape drawn out on the seat,

Once I had the foam cut out, I cut the gel to shape with scissors, It takes some cutting as the gel is very sticky on the inside, but holds its shape very well, just used a bit of tape to seal the edges to stop the gel sticking to everything.

Once this was done, I laid the gel into the foam and it was a perfect fit!

Finishing the seat was then as simple as pulling the cover back over the seat and stapling it back on.

Working from one end i worked around pulling the cover tight and stapling as I went, the seat ended up looking exactly as it did before I started, but with a lot of added comfort!

It was as easy as that, took around 2 hours I suppose from start to finish!

Only been on a couple of 100 mile rides and had no problems, looking forward to the longer couple of hundred mile rides over summer!
